Initially, non destructive testing techniques were introduced in civil engineering during the 40's. The principal need of the engineers was the in situ determination of the homogeneity and the compressive strength of fresh concrete to be able, for example, to remove the formworks.

NDT IN CIVIL ENGINEERING :THE CASE OF CONCRETE BRIDGE DECKS

Various type of non destructive testing methods have been developed and are under development for examining different properties of concrete in addition to the necessary visual inspection. Tests are aimed at assessment of strength and other properties and to locate and obtain corresponding results showing permeable areas, cracks or laminations and areas of lower integrity than the rest.

Nondestructive testing (NDT) is a wide group of analysis techniques used in science and technology industry to evaluate the properties of a material, component or system without causing damage. The terms nondestructive examination (NDE), nondestructive inspection (NDI), and nondestructive evaluation (NDE) are also commonly used to describe this technology.

Nondestructive testing - Wikipedia

Non-destructive testing (NDT) is a testing and analysis technique used by industry to evaluate the properties of a material, component, structure or system for characteristic differences or welding defects and discontinuities without causing damage to the original part. NDT also known as non-destructive examination (NDE), non-destructive inspection (NDI) and non-destructive evaluation (NDE).
