We predicted that red colobus monkeys would show such differences because, like mangabeys, they preferentially use old-growth forest. In contrast, we predict that between-site differences would not occur in redtail monkeys, because they prefer young successional forest, like that covering much of the disturbed site.

INTRODUCTION. The red colobus monkeys [Procolobus (Piliocolobus) de Rochebrune, 1887] represent one of the 'thorniest taxonomic problems among the African primates' (Grubb et al., 2003: 1339). Like the other members of the African colobine radiation [the monotypic olive colobus, Procolobus (Procolobus) verus (van Beneden, 1838), and

The Ugandan red colobus (*Piliocolobus tephrosceles*) or ashy red colobus is an endangered species of red colobus monkey, recognised as a distinct species since 2001.

There is disagreement however over taxonomy with many considering the Ugandan red colobus to be a subspecies (
