Geometry (from the Ancient Greek: γεωμετρία; geo-"earth", -metron "measurement") is, with arithmetic, one of the oldest branches of mathematics. It is concerned with properties of space that are related with distance, shape, size, and relative position of figures. A mathematician who works in the field of geometry is called a geometer. Until the 19th century, geometry was almost ...

The simplest example of a coordinate system is the identification of points on a line with real numbers using the number line. In this system, an arbitrary point O (the origin) is chosen on a given line. The coordinate of a point P is defined as the signed distance from O to P , where the signed distance is the distance taken as positive or negative depending on which side of the line P lies.

Munkres's "Analysis on Manifolds" is a better alternative for self study (see my Review on this book). Bartle's "Elements of Integration and Lebesgue Measure" provides a clear though not particularly thorough introduction to Lebesgue theory.

Last, the labeling pattern was propagated back to each subject's clusters by maximization of spatial overlap using Munkres' assignment algorithm (Munkres 1957). We then calculated probabilistic maps representing the overlap of these clusters across the subjects and hence interindividual variability.
